Abstract
The purpose of this research was to determine whether or not implementing Hess' Cognitive Rigor Matrix within fifth-grade independent learning contracts would increase student time on task. There were 25 fifth-grade student participants in the study and the study took place over four-weeks. Data was collected through a pre/post-assessment on specific topic, student engagement observation, student/teacher conferences, and the Student Data Gathering Tool. While initial research suggests that the implementation of Hess’ Cognitive Rigor Matrix with independent-learning contracts increases student engagement, further research should be done to determine whether or not engagement would be sustained throughout a longer period of time.

Keywords: engagement, learning-contract, personalized, enrichment, Hess’ Cognitive Rigor Matrix
The beginning of the school year is an exciting time for me. I always look forward to seeing my class lists, learning about my students, and planning lessons for a new group of children. This year was no different. However, I was presented a new challenge when I was assigned the “Honors” fifth-grade classroom. This meant all of the students entering my classroom were at or above grade-level in both reading and mathematics. While I was excited to teach this group of students, I quickly found these learners needed additional opportunities to exceed and this would bring a new set of challenges. Enrichment education is often regarded as something extra, or something to try if there is remaining time in the lesson. My students entered the school year excited, motivated and ready to learn. Knowing the importance and difficulty of keeping above-level students engaged, I wondered: how do I continue to challenge my students and keep them engaged throughout the year?

In my fifth grade classroom, there is a 45-minute block of time called small group time. During this time of day, I instruct a small group of 3-5 students for guided reading interventions at my back table. While I am teaching small group lessons, the remaining students are expected to work on assignments individually or read an independent choice book. However, I found that many of my students were not on-task during small group time when expected to work independently and it was no longer an engaging time of day. I wanted to find a way to keep my students challenged, engaged, and on task while working independently.

Additionally, I also provide whole-group instruction to my students in the subjects of math, reading, science, social studies, and spelling. These lessons typically begin with me teaching the entire class a lesson on a new topic and then assigning my students a task to work on that is related to the academic topic. During this work time, I continually observed my students working at a variety of paces and finishing the tasks at different times. Those students
that finished before the rest of the class lacked a new activity to complete, became bored, and entertained themselves by acting out behaviorally or becoming a distraction to others. My students needed an engaging task they could work on independently so that I could be fully attentive to the small group I was instructing.

The setting for this study took place in a fifth grade classroom at a pre-kindergarten through eighth grade charter school in a metropolitan suburb. Each grade-level has five classrooms totaling approximately 900 students. The school population is diverse with 53% African-American, 20% Caucasian, 14% two or more races, 7% Hispanic, and 6% Asian. 10% of students are English Language Learners and 9% of students qualifying for Special Education services. Additionally, 62% of students qualify for Free and Reduced lunch services.

All participants in this study are in one fifth grade classroom. This classroom has 26 students including 15 females and 11 males. Two students qualify for special education services. This classroom is labeled as an Honors classroom in the school, meaning every student met or exceeded standards on the 2016 Minnesota Comprehensive Assessment (MCA) in math and reading as fourth graders. The Honors students are grouped together to provide necessary enrichment opportunities. This in itself can be a challenge, but the additional challenge of leading an Honors class is keeping all students engaged at all times.

This challenge of constant enrichment-focused engagement led me to the topic of this research. My review of the literature on enrichment education shaped the design of my independent-learning contract intervention. This action research focused on the following question: What effect does implementing Hess' Cognitive Rigor Matrix within fifth grade independent learning contracts have upon student engagement and time-on-task?

**Literature Review**
Students of varying academic abilities, background knowledge, and experience are filling today’s diverse classrooms. While there are many known interventions and instructional strategies to support struggling readers, enrichment opportunities for above-level students often lack in classrooms. According to a study completed by the National Resource Center of the Gifted and Talented, “Talented readers received little to no differentiation for reading…students who read above grade level usually received instructional and curricular materials identical to those of students who read at grade level” (Reis, Eckert, McCoach, Jacobs, & Coyne, 2008, p. 299). There is a need for quality enrichment implementation for above level learners.

Implementing Hess’ Cognitive Rigor Matrix into instruction can provide an opportunity for educators to challenge learners in different ways (Hess, Carlock, Jones, & Walkup, 2009b). In the following paragraphs, differentiation, enrichment, and acceleration are each defined, personalized education methods are described, challenges in enrichment are identified, and the Hess’ Cognitive Rigor Matrix is explained.

**Definitions**

**Differentiation.** For the purpose of this research, definitions provided by Hall (2002) and Tieso, (2004) will be utilized for understanding differentiation. Hall (2002) defines differentiated instruction as,

A process to approach teaching and learning for students of differing abilities in the same class. The intent of differentiating instruction is to maximize each student’s growth and individual success by meeting each student where he or she is, and assisting in the learning process (p. 2).

Differentiated instruction includes the use of pre-assessment, flexible grouping practices, student choice and preferences, and collaborative teaching (Tieso, 2004).
**Enrichment.** For the intents of this research, enrichment will be synonymous with extension (Beecher & Sweeny, 2008; Yeng, 2005). Yeng (2005) defines enrichment as, “any experience that replaces, supplements, or extends instruction beyond that normally offered by the school” (p. 2). Enrichment provides the extension of the typical academic curriculum for students to study a topic in depth (Beecher & Sweeny, 2008).

**Acceleration.** Acceleration is a process in which students move through academics more quickly than the typical pace of learning or jump grade levels (Castellano, 2010). Acceleration allows students to move more quickly through the curriculum, assuming students are motivated and ready to do so (Castellano, 2010). Acceleration is not enrichment.

**Enrichment opportunities and strategies**

**Personalized education.** One essential component of effective enrichment education is personalized education. According to Olanchek (2001), differentiation must be personalized to be effective for gifted students. Teachers are not only responsible for students’ education; students are responsible for evaluating their learning interests and preferred learning methods (Olancheck, 2010). Students in need of enrichment often are not getting the instruction they require due to the overall demands of the whole class (Renzuli & Reis, 1998). Personalized education allows for the needs of all students to be met (Renzuli & Reis, 1998).

**Learning contracts.** Above-level students are often not given opportunities to be challenged in the classroom (Renzuli & Reis, 1998). Learning contracts are one method for personalizing education to engage and motivate above level learners (Boyer, 2003). According to Boyer (2003), learning contracts are a basic form for creating individualized assignments with personal learning objectives. Boyer (2003) describes eight steps for the creation and implementation of learning contracts; “Diagnose learning needs, specify learning objectives,
specify learning objectives and resources, specify evidence of accomplishment, specify how the
evidence will be validated, review of the contract, carry out the contract, and evaluation of
overall learning” (p.51). Developing and carrying out learning contracts require teachers to
identify learning preferences and prepare activities that are ideal for each student, which
increases engagement and learning in students (Boyer, 2003; Stephenson & Laycock, 2005).
Learning contracts also require students to identify their own learning preferences, strengths,
and areas to improve as they work with their teacher to agree upon a learning contract (Boyer,
2003). Completing learning contracts allow students to take ownership and be accountable for
their own learning (Stephenson & Laycock, 2005). While most students in Boyer’s (2003) study
enjoyed the process of using learning contracts, some were uncomfortable with the
“untraditional nature” of learning contracts (p.373).

**Schoolwide enrichment programs.** Much success has been found in meeting the goal of
engaging students and enhancing learning all the while empowering student voice, choice and
honoring true differentiation (Allen, 2016; Beecher, 2008; Renzuli & Reis, 1998). One program
that has found success in providing enrichment opportunities is the implementation of
Schoolwide Enrichment Models (Reis et al., 2008). Schoolwide Enrichment Models (SEM) are
programs designed to increase engagement inside the classroom (Renzuli & Reis, 1998). The
SEM model includes three services: Identifying and encouraging students to learn about topics
that interest them, using curriculum modifications and compacting, and allowing students to self-
choose activities (Reis et al., 2008). Reis (2008) completed a study to assess the effectiveness of
implementing the SEM-R model compared to regular reading instruction with third-fifth grade
students in two schools. The results of this study found that the group of students using the SEM
model scored significantly higher (Renzuli & Reis, 1998).
Another enrichment program implemented is the Writer’s Workshop model (Beecher, 2008). The Writer’s Workshop model encourages students to “develop their own voice through writing” (Beecher, 2008, p.510). This program allows for differentiated instruction by allowing students to work at their own pace, learn, and be informally assessed by teachers through one-on-one student-teacher conferences (Beecher, 2008). Students are challenged and kept engaged by developing their writing at the stage for which they are ready (Beecher, 2008).

The results of Schoolwide Enrichment Programs are overall positive. By implementing Schoolwide Enrichment models, gifted students’ attitudes towards their learning and school increased, students were more engaged in their learning, and scores in all subject areas increased on statewide assessments. (Beecher, 2008). Allen (2016) found that SEM “promotes diversity and excellence in education by holding high standards for all learners, regardless of age, ethnicity, gender, education, or socioeconomic conditions” (p. 91).

**Challenges in Enrichment**

While there are many strategies and systems that are successful in providing enrichment education, there are still challenges. Teachers are hesitant to incorporate new practices, even when evidence of success is clear (McAdamis, 2000). Change can bring anxiety and stress, while some teachers see new practices as threatening (McAdamis, 2000). Much of this anxiety is brought on by the uncertainty teachers can be successful with the new practice (McAdamis, 2000). Teachers tend to revert to practices where they have experience (McAdamis, 2000).

Another challenge is that much of the curriculum and literature provided to schools and subsequently, teachers, is not rigorous enough to provide enrichment for gifted learners (Renzuli & Reis, 1998). Renzuli and Reis (1998) report the academic rigor, or difficulty, of academic textbooks has decreased over the last few decades. Renzuli and Reis (1998) also states that
textbooks incorporate a significant amount of content repetition to help non-gifted learners, which only bores and disengages the learner needing enrichment.

**Scaffolding Tools for Differentiated Instruction**

**Bloom’s Taxonomy.** Bloom’s Taxonomy (See Appendix E) can be used to scaffold questions and increase rigor and understanding (Agarwal, 2011). According to Agarwal (2011), “the original taxonomy include six categories of cognitive skills, ranging from simple to complete: knowledge, comprehension, application, analysis, synthesis, and evaluation” (p.2). Agarwal (2011) explains this taxonomy is a step-by-step process where one must master lower level questions or application before moving on to the next step of higher level questions and application. Teachers often use this taxonomy to encourage their students to "climb to a higher [level of] thought” (Forehand, 2010, p. 2).

In a study completed by Gillies and Haynes (2001), they found when children are given the opportunity to have their instruction scaffolded by using a variety of levels of questioning, students are more likely to give thoughtful responses than when given one repeated question type. Agarwal (2011) supports this statement as he emphasizes that using a combination of higher and lower level questions allows students to experience a deeper level of understanding. Using a variety of methods to provide evidence of understanding can also increase engagement throughout the lesson (Agarwal, 2011).

**Webb’s Depth of Knowledge.** Webb’s Depth of Knowledge (DOK) (See Appendix F) aids in determining cognitive understanding and application of content (Holmes, 2012). Webb’s DOK is similar in structure to Bloom’s Taxonomy with levels to use for scaffolding from basic to advanced (Holmes, 2012). The levels are defined as follows: Level 1: Recall; Level 2: Skill/Concept; Level 3: Strategic Thinking; and Level 4: Extended Thinking (Holmes, 2012).
Hess et al. (2009b) describe these levels as, “dependent upon how deeply students understand and engage with the content, not simply the type of thinking used” (p. 3). While Bloom’s Taxonomy categorizes the way the brain processes a new skill, Webb’s DOK focuses on the scope of a task from start to finish (Hess et al., 2009b). “Webb’s model dictates that depth-of-knowledge levels do not necessarily correlate to the commonly understood notion of ‘difficulty’. That is, an activity that aligns to a particular level is not always ‘easier’ than an activity that aligns to a DOK level above it” (Hess et al., 2009a, p. 3). Using Webb’s DOK can assist teachers in determining how thoroughly students understand the required content to be considered proficient (Hess et al., 2009a). Webb’s work has challenged how states design comprehensive assessments as it allows states to decide how in-depth students should demonstrate their understanding of the required content (Hess et al., 2009a; Hess et al., 2009b). Teachers can also use Webb’s DOK levels to analyze the alignment of curriculum, instruction, assessment, and standards (Hess et al., 2009b). Additionally, by identifying DOK levels of not only state comprehensive assessments; but also classroom unit assessments, teachers can determine the depth of understanding needed and adjust daily instruction as necessary (Hess et al., 2009b).

**Hess’ Cognitive Rigor Matrix.** Hess et al. (2009b) created the Cognitive Rigor (CR) Matrix (See Appendix G) to both connect and compare Bloom’s Taxonomy and Webb’s Depth of Knowledge. By using Hess’ CR Matrix, teachers can analyze curriculum and instruction to determine whether or not students will be able to show multiple areas of understanding in one objective (Hess et al., 2009b). Hess et al. (2009b) states, “Because cognitive rigor encompasses the complexity of content, the cognitive engagement with that content, and the scope of the planned learning activities, the CR Matrix can enhance instructional and assessment practices at the classroom level as well” (p. 6). This allows teachers to differentiate their instruction for
individual students and fulfill their responsibility of providing rigorous educational experiences to all students, regardless of academic ability or learning preferences (Hess et al., 2009a; Hess et al., 2009b). Applying Hess’s CR Matrix to learning tasks increases the complexity of understanding (Hess et al., 2009a). According to Hess et al. (2009b), “Students learn skills and acquire knowledge more readily when they can transfer their learning to new or more complex situations, a process more likely to occur once they have developed a deep understanding of content” (p. 8).

**Conclusion**

For enrichment education to be effective, teachers must use personalized and intentional strategies (Olancheck, 2001). Students need the opportunity to have choice in their learning and pursue topics of personal interest (Boyer, 2008; Reis et al., 2008). Incorporating enrichment clusters and learning contracts can allow above level learners to be motivated to take ownership of their learning (Allen, 2006; Boyer, 2008; Reis et al., 2008). While enrichment education can be overwhelming for teachers, using Hess’ Cognitive Rigor Matrix can assist teachers in personalizing curriculum and instruction with the appropriate amount of rigor and challenge (Hess et al., 2009b).

**Methodology**

The study, lasting four weeks, began in February 2017 and ended in March 2017. The study used four-data collecting tools including a pre- and post- content assessment (See Appendix A for pre- and post- assessment collecting table), on-task observation data (See Appendix B), teacher/student conference data (See Appendix C), and student data gathering tool via Google Forms (See Appendix D). The purpose of each of these tools was to understand the effects of implementing personalized learning contracts in a fifth grade classroom.
On the first day of the four week study, I administered a pre-assessment to determine my students’ academic levels to effectively create individual learning contracts. The pre-assessment included questions that related to content I would be teaching over the course of the four week study, including the topics of reading learning objectives: cause and effect, problem and solution, and sequencing. The pre-assessment consisted of a combination of reading passages and multiple choice comprehension questions. I graded and recorded the data as the percentage of questions correct. Using students’ pre-assessment scores, I created independent learning contracts utilizing Hess’ Cognitive Rigor Matrix. Each student’s independent learning contract was tailored to their learning preferences and academic needs.

In order to determine my students’ on-task behavior prior to implementing independent learning contracts, I observed and recorded their on-task behavior for five days. During each observation, I noted the date and time of the observation, academic subject taking place, setting, number of students in the classroom, and number of students on-task during the observation. I collected data on student time on-task daily during our small group block. I also observed student time on-task behavior during non-independent learning contract times during different academic subjects on a rotational basis during the first week. The purpose of observing student on-task behavior twice a day was to determine whether or not students were on-task more often when able to work on their independent learning contract during their small group block and additional academic block.

After collecting baseline data, I taught the procedure for learning contracts to my class on the first day of week 2. I explained that each student would receive an independent learning contract on the first day of each week. Each student’s learning contract was unique to each student and designed to meet their own individual needs. Students completed these assignments
during our small group instruction block when working independently. Students also worked on their independent learning contract if they finish an assignment in another subject early. If a student chose not to work on their learning contract assignment during small group block, then their choice for independent work would be reading.

Once independent learning contracts were implemented on week 2, day 1, I continued to observe and collect data on my class’ on-task behavior during our small group block and an additional academic block daily. An instructional coach from my building also occasionally observed and documented my class’ on-task behavior so that I could continue my regular teaching tasks and also to provide inter-rater reliability.

During teacher-conferences, I met individually with students for approximately five to ten minutes regarding their independent learning contract and progress. During these conferences, I recorded the content of our conversations and notes about in-progress or completed assignments. I met with approximately five students per day, but due to unforeseen schedule changes, sometimes I had to meet with more or less students or make up conferences during a different time of day. There were also instances when a student was absent for a significant amount of time and I chose to use their independent learning contract conference time to catch he or she up on essential content that was missed. These occurrences were documented as well.

At the end of the study, each student completed a post-assessment. The questions on the post-assessment were based on the same content-focused learning targets as the pre-assessment, but with different reading passages and comprehension questions. As done for the pre-assessments, I graded and recorded the results of the post-assessment using percentages. I used
the results of the post-assessment data to determine whether or not students improved in their mastery of specific learning targets during the study and use of independent learning contracts.

Once the study was complete, my students completed the Student Data Gathering Tool via Google Forms (See Appendix D). Before giving the Student Data Gathering Tool to my students, I explained the purpose of the Student Data Gathering Tool was for me to receive their feedback on independent learning contracts and the results would be used during this study. I reminded my students their answers would remain anonymous and I wanted their honest opinions. I also read each question of the Student Data Gathering Tool aloud to my class to avoid any confusion with language or the content of the questions.

This Student Data Gathering Tool asked students’ for their attitudes towards independent learning contracts and gave opportunities for students to indicate whether or not they found independent learning contracts to be beneficial towards their learning. Students also responded on how I could improve independent learning contracts for future classes. Each student completed the Student Data Gathering Tool independently on my school laptop one at a time. Due to student absences and time-restraints due to required standardized testing, 22 of 26 students completed the Student Data Gathering Tool.

Data Analysis

Student Engagement

During the first five days of the study, I collected baseline data using the on-task observation form to determine whether or not students were engaged during independent work times prior to the independent learning contract intervention. To determine student engagement, I recorded the number of students on-task compared to the number of students observed off-task.
recorded student engagement daily during our small group block and during another academic subject for a total of two observations per day. The baseline data is shown on Figure 1.

After collecting the baseline data for student engagement, I implemented the independent learning contract intervention for 3 weeks. I continued to record student engagement daily during our small group block and during another academic subject throughout those three weeks. Figure 1 shows the average percentage of students on-task during each week of the study.

![Student Engagement Graph](image)

**Figure 1. Student engagement**

Figure 1 shows student on-task behavior increased throughout the intervention in both our small-group block and other academic subjects. During our small-group block, the baseline data for student engagement was 78.41% of students on-task. After the independent learning contract intervention was implemented, the percentage of students on-task ranged from 81.47% to 87.73% during the three week time period. Student engagement during other academic subjects also increased from the baseline data of 85.07% students on-task to a range of 86.85% to 92.86% after the intervention was implemented.

**Pre-Assessment and Post-Assessment**
The purpose of wanting to increase student engagement is to increase student academic achievement. During the study, I taught three reading strategies: cause and effect, problem and solution, and sequence. I administered a pre-assessment and post-assessment for each of the strategies to determine whether or not students improved on their mastery of the strategy during the three week study. I recorded the results of the pre- and post-assessments and from this data, determined whether or not students made academic growth.

Figure 2 shows the results of the pre- and post-assessments. I scored each assessment and found the class average score. The results of the post-assessment when compared to the pre-assessment show academic growth for each reading strategy. The class average scores increased 24.7% for Strategy #1: cause and effect, 20.1% for Strategy #2: problem and solution, and 17.4% for Strategy #3: sequence. While the independent learning contract intervention could have led to the increase in student academic achievement, it is possible that whole-group reading instruction impacted the results as well.
Teacher Conference Observations

For three weeks, I met with each student once a week to discuss their learning contract. Conferences were used as a qualitative assessment on the effectiveness of the implemented independent learning-contracts so I could adjust the contracts as needed throughout the intervention to meet the student’s needs. I initially planned on recording the number of independent learning contract assignments each student completed, but quickly realized that would not be an effective measure of student engagement. This is because some students chose small, short assignments and some students chose assignments that required more time. Students who completed a smaller number of tasks were not necessarily less engaged than students who completed a larger number of shorter tasks. While my plans for data collection changed, I still gathered a large amount of valuable information while completing these conferences.

During these weekly conferences, I recorded the type of assignments completed, the number of assignments completed, and observations on the quality of the assignments completed. Students #6, #12, and #25 consistently chose to work on longer, more complicated tasks which required a large amount of engagement. I recorded that their assignments were of high quality. Respectively, students #3 and #17 consistently chose shorter assignments. I observed that these students seemed to finish the assignments quickly and without much thought. A question emerged from this data as I wondered if these students were truly engaged during independent work time or if the assignments were simply busy work.

While looking at the conference data, I looked to see if there were any students that started the intervention by choosing shorter assignments and began choosing more advanced assignments. I did not notice any changes in assignment choices throughout the intervention.
This could be because students that chose simpler tasks were more comfortable with these types of assignments and needed more guidance from me during conferences to be successful. This could also be because the length of the research study, three weeks, was too short.

Student #9 consistently did not have any assignments completed each week during the intervention. Even when I adjusted his learning contract assignments to meet his zone of proximal development, he still was not coming to his conference with a completed assignment. I realized that for him, I needed to find a different way to keep him engaged during independent work times.

Throughout the conferences, I had several students asking for specific tasks to be added to their independent learning contracts. Students #7, #24, and #25, asked for more math assignments during their conferences. Student #27 asked if she could have more writing assignments added to her independent learning contract that were related to the week’s learning objectives. I was able to use this information to adjust each independent learning contract to make the contracts more engaging for the particular student.

Another source of data collected, was when students created their own assignments they wanted added to their independent learning contracts. After the first week, I quickly observed that student #18 was able to complete each task easily indicating a need to be challenged. Together, we were able to brainstorm an independent research project on cheetahs that she created. We checked in each week on her progress and I recorded high levels of achievement and excitement, which ultimately indicated a high level of engagement. Students #13 and #17, who typically had a difficult time working independently, created their own note-taking assignment on a book of their choice. During their conferences, I recorded the quality of work was higher than what I typically observe from them. This provided evidence that when student voice and
choice are inserted into work, engagement increases and the quality of work subsequently increases.

Throughout the intervention, I had several students ask to meet with me to share their learning contract assignments above and beyond the weekly conference. I made note of this and recorded the context of our discussion. Student #11, who typically avoided work tasks, asked to meet five times to show me his assignment during the three week intervention. Student #25 asked to meet two times after our initial conference to show me the improvements she had made to her writing assignment. Students #12, #20, and #24, also asked for meetings to show what they had been working on throughout the week. All of these extra meetings indicate these students were excited and proud of what they are working on. When students are excited about what they are working on, they are more engaged in their learning, which leads to greater academic achievement.

**Student Data Gathering Tool**

Once the study and independent learning contract intervention was complete, I had my students independently complete a Google Form to gather feedback on the independent learning contracts. Students were told they would not be graded on their responses and their honesty would be used to help future classes and for this study. Each question was not required, thus some students chose not to respond to all the questions on the Student Data Gathering Tool.

The first question asked, “From a scale of 1-10, what are your overall feelings towards learning contracts?” On the scale, “1” stood for, “I did not enjoy learning contracts” and 10 stood for, “I really enjoyed learning contracts”. The results are shown on Figure 3.

The mode response for this question was a 5 and 6, showing my students had neutral feelings towards their independent learning contracts. This information indicates that my
students somewhat enjoyed their independent learning-contracts, but I will need to adjust the intervention to positively improve their liking of the learning contracts.

**Figure 3.** Question 1 of Student Data Gathering Tool results

The second question asked students to describe the level of challenge within their learning contract. Students rated their learning contract from a 1-5, “1” meaning “too challenging” and “5” meaning “too easy”. Figure 4 shows the student responses. The mode response was a 3, with 72.7% scoring a 3 or higher which indicates most students felt the difficulty of their learning contract was appropriate. However, 27.3% of students responded with a “2”, meaning their independent learning contract was a bit too challenging. It is unknown whether or not students felt the amount of tasks were challenging or the content of the tasks themselves.
Figure 4. Question 2 of Student Data Gathering Tool

The third question of the Student Data Gathering Tool asked, “Was the amount of assignments expected reasonable?”. Students were given the option to respond “yes” or “no”. Figure 5 shows 64.7% responded the amount of assignments were reasonable and 35.3% of students responded the amount of assignments were not reasonable. It is unknown whether or not students responding with the work was unreasonable believed there should be fewer assignments or more assignments.
Figure 5. Question 3 of Student Data Gathering Tool

The fourth question on the Student Data Gathering Tool asked students, “Were one-on-one conferences with Ms. Carlson helpful?”. Students had the option to respond “yes”, “no”, or “neutral”. Figure 6 shows the majority, 59.1%, of students responded the conferences were helpful. Almost a third, or 31.9% of the students responded ‘neutral’ to whether or not one-on-one conferences were helpful while 9.1% of students responded the conferences were not helpful to their learning.
Students were also asked whether or not I should complete learning contracts with future students. Students had the option to choose “yes”, “no”, or “neutral”. The responses are shown on Figure 7. The majority, or 63.6%, of students responded that future classes should complete independent learning contracts. This suggests the majority of my students enjoyed independent learning contracts and believe other students would too. Twenty-seven percent of the students answered with neutral, it is unclear whether or not they enjoyed or disliked learning contracts. A small percentage, 9.1%, of the students did not think I should continue independent learning contracts with future students.

Figure 6. Question 4 of Student Data Gathering Tool
The last question of the Student Data Gathering Tool asked, “What should Ms. Carlson do to improve learning contracts for next year?”. This was an open ended response. I categorized the responses into seven categories as shown on Figure 8. While any data directly from students, is good data, this particular set was not beneficial to the study. Only 60% of the students chose to respond to this question and the student responses given did not have a common theme. Due to the variety of responses provided on how to improve independent learning-contracts, I will need to continue to adjust learning contracts on a personal basis to meet the needs of all of my students.
Figure 8. Question 6 of Student Data Gathering Tool

Action Plan

The focus of this study was to determine whether or not implementing independent learning contracts using Hess’ cognitive rigor matrix would increase student engagement in a fifth-grade classroom. I was able to come to several conclusions from this study. I found that the intervention positively affected student engagement, student academic performance increased, and student/teacher conferences provided important student information.

My research demonstrated a positive relationship between implementing independent learning contracts and student engagement. Student engagement increased during the independent learning-contract intervention in both the small-group reading instruction block and other academic subjects throughout the day. While student engagement did increase over the course of the study, I cannot come to the definitive conclusion that increased student engagement
would be sustained throughout the school year. My students may have been more engaged simply because it was a new activity and routine that was introduced.

The data from this study showed my fifth-grade students achieved academic growth in their reading skills over the course of the study. The results from the pre-assessment and post-assessment indicate my students improved in the areas of cause and effect, problem and solution, and sequencing. Although students did improve academically over the course of the study, I cannot conclude that independent-learning contracts were the only contributing factor to their academic growth. Further research will need to be done to determine whether or not other factors such as whole-group instruction or other reading interventions were a factor in the results.

Student/teacher conferences were essential for personalizing each student’s learning contract to meet their specific needs. These meetings allowed me to observe the types of assignments students were completing and assess whether the students were truly engaged in their work. I was able to have conversations regarding students’ specific interests and adjust their learning contract accordingly. I was able to gather valuable qualitative information from these meetings that I used to adjust my instruction for the remainder of the school year.

The results from the Student Data Gathering Tool showed that students overall had neutral feelings towards the independent-learning contracts, yet the majority agreed I should implement independent learning-contracts with future classes. In order to increase student excitement towards independent learning-contracts, I would need to continue to meet with students regularly to personalize their contracts to individual wants and interests.

The information gathered from this research will impact my teaching moving forward. I believe there are many benefits from the implementation of independent learning-contracts in a fifth grade classroom and I intend on continuing the use of independent-learning contracts in my
classroom. The independent learning-contracts allow for students to take ownership of their learning by choosing which tasks and assignments they are going to complete. I believe independent learning-contracts will help increase engagement in students who have difficulties working independently. My students will always have something to do, so students will be engaged in their learning more often.

Furthermore, I learned a significant amount of information from the one-on-one teacher/student conferences and will continue having these conferences with future classes. I would like to implement conferences early on in the year with my students to quickly learn important information such as student learning preferences and interests. I can use this information to adjust my whole-group instruction to meet the needs of the majority of my students. I also can use the information given to determine what small-group interventions I need to provide for further personalized instruction. After completing my research, I believe there are many areas for continued investigation. While I focused my independent learning-contracts on reading activities, further research would need to be done to determine whether or not a math independent-learning contract intervention would have similar results.

The students who participated in this study were at or above-grade level in the areas of mathematics and reading. Most likely, I will be instructing a variety of learners in the future. I am interested to see if the independent-learning contract intervention would be successful in increasing student-engagement if implemented with students who were struggling academically. If students who are struggling academically are more engaged throughout the school day, would their academic performance increase as well?

Additionally, this intervention took place over a three-week period. While the initial findings show that student engagement increased during the implementation of independent-
learning contracts, I would like to continue this study over a longer period of time. I would use that study to determine whether or not student engagement would continue throughout the school year or if students would become less engaged over time.

Appendix D: Student Data Gathering Tool
From a Scale of 1-10, what are your overall feelings towards learning contracts?

1 2 3 4 5 6 7 8 9 10
I did not enjoy learning contracts
I really enjoyed learning contracts

From a scale of 1-5, how challenging was your learning contract?

1 2 3 4 5
My learning contract assignments were too easy.
My learning contract questions were too challenging.

Was the amount of assignments expected reasonable?

- Yes
- No

Were one-on-one conferences with Ms. Carlson helpful?

- Yes
- No
- Neutral

Should Ms. Carlson complete learning contracts with her future classes?

- Yes
- No
- Neutral

What could Ms. Carlson do to improve learning contracts for next year?
